

Composite Grates & Drainage Systems

Amlite's new Composite Grates and Drainage systems are produced for use in all aspects of Civil Engineering including roadways.

Designed as a high strength cost effective alternative to traditional metal systems, composites have the clear advantage of limited scrap value deterring theft and subsequent health and safety issues. A key point is zero theft equates to zero holes in the roadway while replacements are pending installation.

With the addition of lock down points these composite gully grates offer the advantage of limiting the ability to gain access to unauthorised persons.

Amlite offers a large number of size, class and design options within its range of drainage systems and can be manufactured in a variety of colours (standard black) to suit specific applications. Please visit www.amliteltd.com for further details.

Code	Class	Lock	A	B	C	H1	H2
